Project 3 Proposal

For project 3 I will be making a simple image gallery. I made this app in iOS already that lets the user look through all my paintings and drawings, and now I want to extend my (theoretical) user base to android. Here is the UX flow of the app.

Upon opening the app the user will be presented with grids of categories for Painting, drawing, digital, etc. The user chooses a category and is then taken to a gallery view of the works within that category. When the user selects a work, they will be given a detail screen that has two fragments: the top one which will be a zoomable image view, and the second which will be a details about the Title, medium and year.

As far as visual design goes, I'm not entirely sure how the app will look, as I am not familiar enough with all the elements of the android SDK, but I'd like the images to be in a grid layout with minimal padding and spacing between elements.
