Project 2 will be an extension of Project 1 for me. I will continue to add functionality to my Spice Rack application to make it a more polished project. in addition to the feedback I've received from the user(s) and from Aileen, I will be designing a more aesthetically pleasing application while focusing on added features. Many of the features were proposed in the initial design of this app and include Search functionality, adding items to reminders.app, and the ability to switch between collectionView and TableView. I've already begun working on this functionality, and it can be seen in the Project 2 folder on Github.

For the Grad project I will be taking a focus on aesthetics. This class is centered around app development and for the graduate section of this project, I will be focusing on app design. I intend to use some tutorials and frameworks from around the web like IBAnimate.framework, Spring.framework and some material design principles while adhering to Apple's HCI guidelines. While some aspects of the design are already in place, It is my goal to make a very aesthetically pleasing app.

Some examples of what I am envisioning can be seen below. The features include:
animated transitions
table view with background cell
background cell matches percentage remaining as a horizontal progress bar.
animated pop up view to affirm user action.
